

Anti-algae tensioned cover

Genap

Anti-algae tensioned cover for water silos

During storage, water becomes contaminated with algae which results in irrigation systems becoming blocked and all of the consequences that entails.

Genap has a number of solutions for this in its product range. These cover systems are an appropriate solution for combating algae growth, they also prevent evaporation and to a large extent they prevent contamination of the water.

The tensioned cover is available for silos that are installed inside or outside. The covers are made from Genatex 700, which is an open woven fabric that is water permeable but which keeps out dirt and light.

The tensioned cover is designed with a flap and reinforced edge with rings and is tensioned over the silo. Any diameter of cover can be used for inside use, with a maximum of 7 metres for outside use.
